

Week 5 supervised learning

1. what is a classifier and labels?
2. What is binary and multiclass classification?
3. What are features?
4. What algorithms can only take numerical features?
5. What algorithms can only take categorical features?
6. What is multi-label classification?
7. What are the stages in supervised learning?
8. What is confusion matrix? What is the goal?
9. How do we calculate accuracy?
10. How do the k nearest neighbor algorithm work? What are the stages? How do we choose k and what factor decides the value of k? what are the downsides of KNN
11. Why do we scale the data? Should we apply scaling/normalizing before or after splitting it into training and testing?
12. What is max-min-scaling?
13. What is normalizing?
