

Week 6 perceptron and linear regression questions

1. What is the perceptron? What are the steps in the algorithm (4)?
2. Why do we add the bias term to the perceptron?
3. How do we initialize the weights? How do we update the weights in perceptron? What is the formula?
4. What is linear separability?
5. What is a linear classifier?
6. What is the goal in regression? What is the difference between classification and regression?
7. What is linear regression?
8. How can we tell whether a line is a good fit for the data?
9. What are the steps in linear regression?
10. What is inductive bias?
